Summary

Software Engineer with hands-on experience building full-stack applications using Python, TypeScript, FastAPI, Next.js, PostgreSQL, and AWS. Experienced in developing end-to-end applications and contributing to production systems, with a strong foundation in software development, APIs, databases, authentication, and data structures & algorithms.

Skills

Programming Languages: Python, Java, TypeScript, JavaScript, C, C++

AI & LLM: RAG, LangChain/LangGraph, Prompt Engineering, Vector Embeddings, Semantic Search, Hybrid Retrieval

Backend: FastAPI, Node.js, Express.js, REST APIs, OAuth 2.0, JWT, Middleware, WebSockets

Frontend: Next.js, React.js, Tailwind CSS, HTML, CSS

Databases: PostgreSQL, pgvector, Redis, MySQL, Schema Design, Indexing, Query Optimization

Cloud & Tools: AWS, Docker, Git, GitHub

Core Computer Science: Data Structures & Algorithms, Object-Oriented Programming, Database Management Systems, Operating Systems

Core Strengths: Problem Solving, Clean Code, Feature Ownership, Agile Development, Scrum, Collaboration

Experience

Software Engineer Intern, Lifelong Online – Gurugram, Haryana, India May 2026 – Aug 2026

- Built AI-powered applications including an AI hiring platform and AI-based ERP system using FastAPI, Next.js, PostgreSQL, pgvector, and LangGraph during technical ramp-up
- Contributed to a production dock management system deployed across 10+ warehouses and 250+ docks, supporting and optimizing daily shipment operations.
- Built shipment workflows covering gate entry, dock allocation, and departure for Gate Desk, Operations Manager, and Dock Supervisor roles.
- Implemented RBAC and authentication, restricting user actions and data access based on assigned role and warehouse.
- Contributed to API development, QA testing, debugging, code reviews, and production workflows.

Projects

HireIQ - AI-Native Hiring Platform – Independent Project May 2026 – July 2026

End-to-end AI-native hiring platform built independently with FastAPI, Next.js, PostgreSQL/pgvector, and LangGraph, covering candidate matching, AI-graded assessments, and real-time hiring workflows.

- Built a semantic resume-to-job matching engine using vector embeddings, cosine similarity, and cross-domain penalties, with composite scoring across resume and assessment signals for ranked candidate matching.
- Designed a generate → critique → repair workflow for role-specific assessment generation, reducing per-assessment LLM calls by up to 3×.
- Engineered a tamper-resistant assessment system using server-side timing, pre-generated question pools, and violation triggered question swapping to make cheating attempts incur time cost.
- Built WebSocket-based real-time messaging with broadcast, direct, and system messages plus live hiring-stage updates, replacing email-based candidate communication with a structured channel.
- Designed multi-tenant organization management with RBAC, join-code and invite-based onboarding, and cascading administrative controls to enforce data isolation and platform integrity.
- Implemented authentication with short-lived JWT access tokens, HttpOnly refresh tokens, and Google/LinkedIn OAuth 2.0 account linking.

Education

Chitkara University, Bachelor of Engineering in Computer Science – Rajpura, Punjab, India July 2023 – July 2027

- CGPA: 9.15
